Motivation: Why theorists deserve to do physics

Motivation

Higgs

Supersymmetry

Supersymmetry
breaking

AMSB is fascinating

AMSB is detectable

AMSB is sick

AMSB is curable

Conclusions

- The necessity for a Higgs mechanism:
 - Higgs mechanism \neq Higgs scalar boson.
 - We know:
 - The photon exists. $M_\gamma < 0.000\ 000\ 000\ 000\ 000\ 000\ 000\ 2\ \text{GeV}$
 - The Z boson exists. $M_Z = 91.1876 \pm 0.0021\ \text{GeV}$
 - The W bosons exist. $M_W = 80.423 \pm 0.039\ \text{GeV}$
 - Electroweak precision data...
 - ...namely, $M_W = M_Z \cos \theta_W$.
 - The standard model unifies these as $SU(2) \times U(1)$.
- The simplest solution mandates a fundamental scalar Higgs.
- A scalar Higgs must be protected or banished.
 - QFT is unkind to scalars.
 - Strong dynamics banishes the scalar.
 - Extra dimensions protects the scalar.
 - Little Higgs protects the scalar.
 - Supersymmetry relegates (banishes) the scalar.
 - Occam's razor mandates supersymmetry studies.
- The Higgs sector is the gateway to all future understanding.

Why Supersymmetry?

Motivation

Higgs

Supersymmetry

Supersymmetry
breaking

AMSB is fascinating

AMSB is detectable

AMSB is sick

AMSB is curable

Conclusions

- Supersymmetry is the only non-trivial extension of the Poincare group.
- Although not engineered for, we get gifts:
 - A hierarchy solution
 - An explanation for electroweak symmetry breaking
 - GUT evidence and motivation
 - A natural cold dark matter candidate
 - ...and more.

Supersymmetry must be broken

Motivation

Higgs

Supersymmetry

Supersymmetry
breaking

AMSB is fascinating

AMSB is detectable

AMSB is sick

AMSB is curable

Conclusions

- Supersymmetry is spontaneously broken if:

$$e^{i(\bar{Q}Q + \bar{\bar{Q}}\bar{Q})}|0\rangle \neq |0\rangle \quad \square \quad \langle 0|H|0\rangle \neq 0$$

- Need either a fermion condensate, F vev, or D vev.
- For EWSB, we know the breaking pattern because of measurements.
- Gravity mediated supersymmetry breaking problems
 - Flavor problems
 - CP problems
 - No predictable spectrum
 - Structure model building
- Gauge mediated supersymmetry breaking problems
 - Gaugino masses
 - CP problems
 - The $\bar{\mu}$ problem
 - Loss of CDM candidate
 - Structured model building
- Anomaly mediate supersymmetry breaking problems
 - The $\bar{\mu}$ problem
 - Spectrum problem

AMSB is fascinating

Motivation

AMSB is fascinating

Origin

Soft masses

Thresholds

\square term

CP violation

AMSB is detectable

AMSB is sick

AMSB is curable

Conclusions

- Very natural, not optional
- Only 2 parameters and 1 binary choice
- RG invariant soft mass expressions
- UV insensitive
- Solves the supersymmetry flavor problem
- Gauge coupling unification
- Distinct and predictive spectrum
- Modest model building
- Good \square term solutions
- Strong CP problem naturally solved

Origin of AMSB

Motivation

AMSB is fascinating

Origin

Soft masses

Thresholds

Λ term

CP violation

AMSB is detectable

AMSB is sick

AMSB is curable

Conclusions

- AMSB soft mass contributions are always present.
- How can AMSB be the dominant source for soft masses?
 - Our sector and the hidden sector must have no direct (Yukawa, gauge, etc.) interactions.

- A general supergravity theory has the form:

$$L = \sqrt{|g|} \left\{ \int d^4x f(Q^+, e^{iV} Q) + \int d^2\theta [W(Q) + (Q)_{ww} + \text{h.c.}] \right\} + (\text{graviton supermultiplet stuff})$$

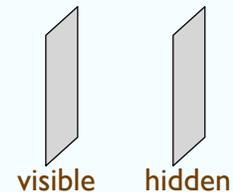

- To dominate, AMSB requires:

$$f = 3m_{\text{P}}^2 + f_{\text{visible}} + f_{\text{hidden}}$$

$$W = W_{\text{visible}} + W_{\text{hidden}}$$

$$\int ww = \int_{\text{visible}} w_{\text{visible}}^2 + \int_{\text{hidden}} w_{\text{hidden}}^2$$

- This is realizable two ways:
 - Geometric separation
 - A conformal hidden sector

2. Giudice, Luty, Ratazzi, Murayama

3. Luty, Sundrum

What is the super-Weyl anomaly? (I)

Motivation

AMSB is fascinating

Origin

Soft masses

Thresholds

β term

CP violation

AMSB is detectable

AMSB is sick

AMSB is curable

Conclusions

- “What is the Weyl anomaly?” (aka conformal anomaly)
 - The Weyl transformation: $g_{\mu\nu}(x) \rightarrow \Omega^2(x)g_{\mu\nu}(x)$.
 - This rescaling can be understood in terms of the (modified) stress-energy tensor $T^{\mu\nu}$.
 - For *classical* scale invariant theories, $\partial_\mu T^\mu{}_\nu = 0$.
 - Quantization generates an anomaly.
- “What is the super-Weyl anomaly?”
 - Just the Weyl anomaly in a supersymmetric theory.

What is the super-Weyl anomaly? (2)

Motivation

AMSB is fascinating

Origin

Soft masses

Thresholds

Ω term

CP violation

AMSB is detectable

AMSB is sick

AMSB is curable

Conclusions

- “What’s supergravity got to do with Weyl transformations?”

- The Weyl compensator formalism of supergravity:

$$L = \sqrt{\Omega} g \left\{ \int d^4x f(Q^+, e^{\Omega V} Q) \Omega^+ \Omega + \int d^2\theta [W(Q) \Omega \Omega \Omega + \Omega(Q)_{\psi\psi} + \text{h.c.}] \right\} \\ + (\text{graviton supermultiplet stuff})$$

- ...by using the Weyl compensator $\Omega = 1 + F \Omega \Omega$.
- ...by a Weyl transformation and substituting out auxiliary fields, canonical supergravity (i.e. Wess and Bagger) is recovered.
- A specific Weyl transformation is required:

$$g_{\mu\nu}(x) \rightarrow \left(1 - \frac{3m_{\text{P}}^2}{f} \right) g_{\mu\nu}(x).$$

- “But the Weyl compensator Ω seems to have nothing to do with the Weyl transformation.”
 - The Weyl compensator Ω makes each term Weyl invariant.

What is the super-Weyl anomaly? (3)

Motivation

AMSB is fascinating

Origin

Soft masses

Thresholds

\square term

CP violation

AMSB is detectable

AMSB is sick

AMSB is curable

Conclusions

- The Weyl compensator \square accompanies all mass scales in the lagrangian.

- A general scale invariant superpotential is 100% Yukawa.

$$W = y_{ijk} Q_i Q_j Q_k$$

- Redefine:

$$Q \square \rightarrow Q \square$$

- If any $\langle Q \rangle \neq 0$, \square would be attached to it after the redefinition.
- Even the cut off scale \square (i.e., Pauli-Villars regulators) get \square attached to it.
- How? Through positing the PV mass to originate from a Higgs mechanism.

- From this, we can now see how to get soft masses.

- For example, to generate gaugino masses:
- Through 1-loop renormalization:

$$\square(Q)_{ww} \square [\square(Q) + 2b \ln(\square \square)]_{ww}$$

- Expanding superfield notation and Taylor expanding yields,

$$M_{\square} = \frac{\square_g}{g} \langle F \rangle .$$

- The scalar and trilinear soft masses are also produced by the same superfield and Taylor expansions.

The pure AMSB spectrum (I)

Motivation

AMSB is fascinating

Origin

Soft masses

Thresholds

μ term

CP violation

AMSB is detectable

AMSB is sick

AMSB is curable

Conclusions

- The MSSM with AMSB has parameters:

$$\langle F \rangle, \tan\beta, \text{ and } \text{sgn}(\mu)$$

- The AMSB spectrum is RG invariant.

$$m_{\mu}^2 = \mu \left[\frac{1}{4} \frac{\partial \mu}{\partial g} g + \frac{\partial \mu}{\partial y} y \right] \langle F \rangle^2$$

$$M_i = \frac{g_i}{g} \langle F \rangle$$

$$\tilde{m} = \frac{\langle F \rangle}{16\mu^2}$$

$$A_y = \mu \frac{y}{y} \langle F \rangle$$

- For example:

$$m_{Q_3}^2(g, y) = \left[\frac{11}{50} g_1^4 + \frac{3}{2} g_2^4 + 8 g_3^4 + y_t \hat{\mu}_{y_t} + y_b \hat{\mu}_{y_b} \right] \tilde{m}^2$$

- 2 parameters.
- Valid at any scale the MSSM is valid.
- Predictive spectrum.
- Flavor diagonal soft masses.
- No explicit model building thus far.

The pure AMSB spectrum (2)

Motivation

AMSB is fascinating

Origin

Soft masses

Thresholds

μ term

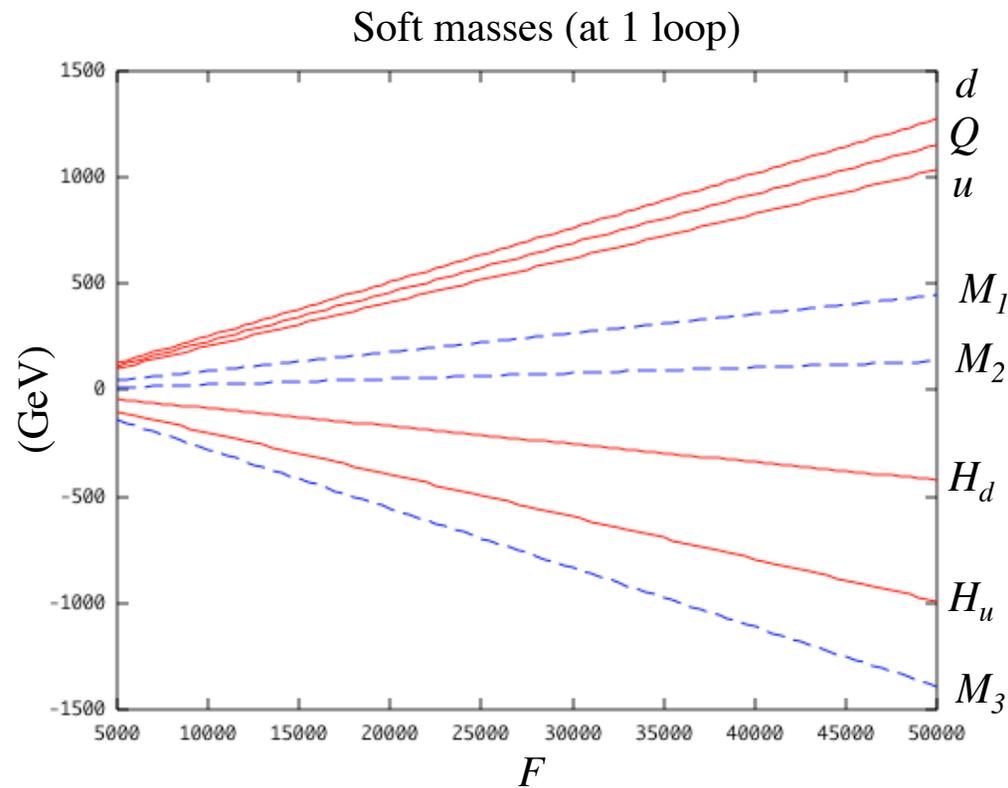

CP violation

AMSB is detectable

AMSB is sick

AMSB is curable

Conclusions

- Here, $\tan\beta = 10$ and $\beta < 0$.
- F controls the scale of the spectrum.
- F should be on the order 10 TeV.

The pure AMSB spectrum (3)

Motivation

AMSB is fascinating

Origin

Soft masses

Thresholds

μ term

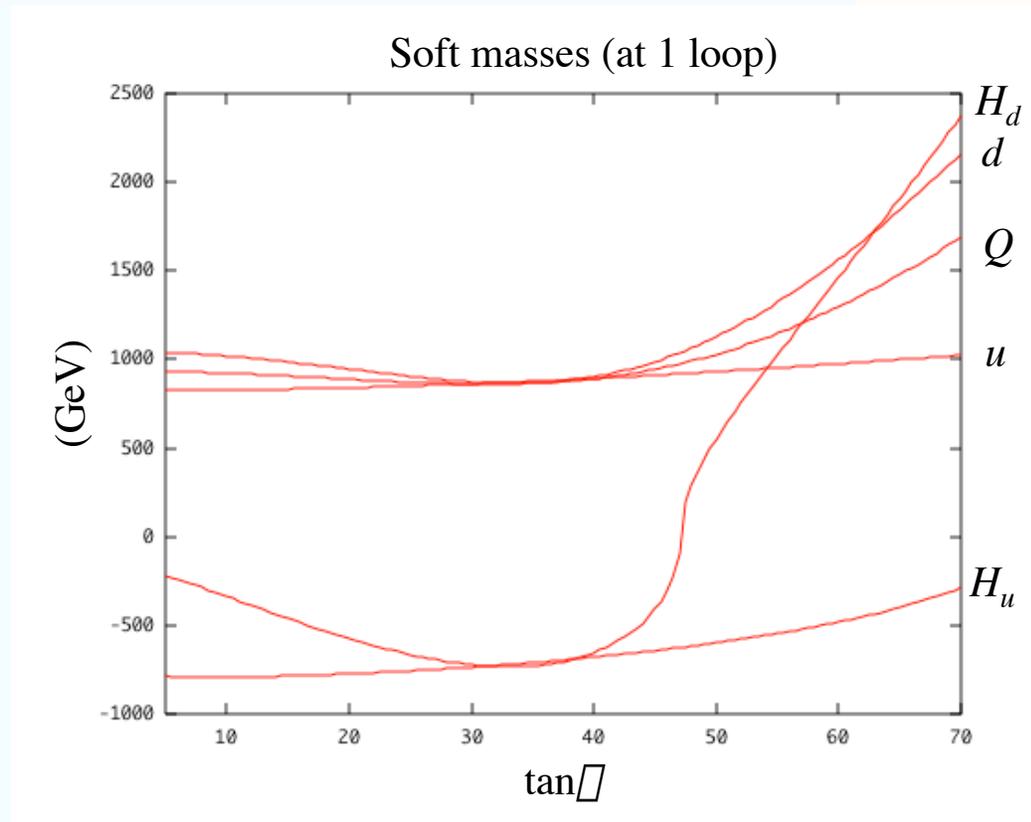

CP violation

AMSB is detectable

AMSB is sick

AMSB is curable

Conclusions

- Here, $F = 40$ TeV and $\beta < 0$.
- $\tan\beta$ controls the qualitative features of the spectrum.
- $M_1 = 358$ GeV, $M_2 = 108$ GeV, and $M_3 = -1,110$ GeV

AMSB and thresholds

Motivation

AMSB is fascinating

Origin

Soft masses

Thresholds

\square term

CP violation

AMSB is detectable

AMSB is sick

AMSB is curable

Conclusions

1. Murayama, Pierce

2. Katz, Shadmi,
Shirman

3. Pomarol, Rattazzi

4. Randall, Sundrum

- Two distinct classes of AMSB threshold corrections:

- Scalar in X defines a threshold.
- “Aligned” thresholds: $X = M\square$ [$= M(1+F\square\square)$].
- Not aligned thresholds: $X \neq M\square$.

- Aligned thresholds:

- Threshold corrections to soft masses are zero (at one loop).
- Threshold corrections to soft masses arise at order:

$$\frac{\langle F \rangle^4}{\square^2}$$

- UV insensitivity
- Flavor problem solution

- Two understandings:

- Pauli-Villars regularization
- Dimensional reduction (DRED) regularization

- Not aligned thresholds:

- May arise when a light scalar singlet is responsible for spontaneously generating the masses of the threshold.
- Large model-dependent threshold corrections.

AMSB is detectable

Motivation

AMSB is fascinating

AMSB is detectable

AMSB CDM

Gauginos at colliders

AMSB is sick

AMSB is curable

Conclusions

- The AMSB gaugino spectrum is distinct:

$$M_1 : M_2 : M_3 \square 3:1:7$$

- ...as opposed to mSUGRA:

$$M_1 : M_2 : M_3 \square 1:2:7$$

- Wino LSP has great detection prospects as CDM
- The lightest chargino and neutralino are nearly degenerate.
- The scalar spectrum of pure AMSB is very predictive, but unacceptable.
- Fixes to the scalar spectrum may retain distinction in some models.

AMSB cold dark matter

Motivation

AMSB is fascinating

AMSB is detectable

AMSB CDM

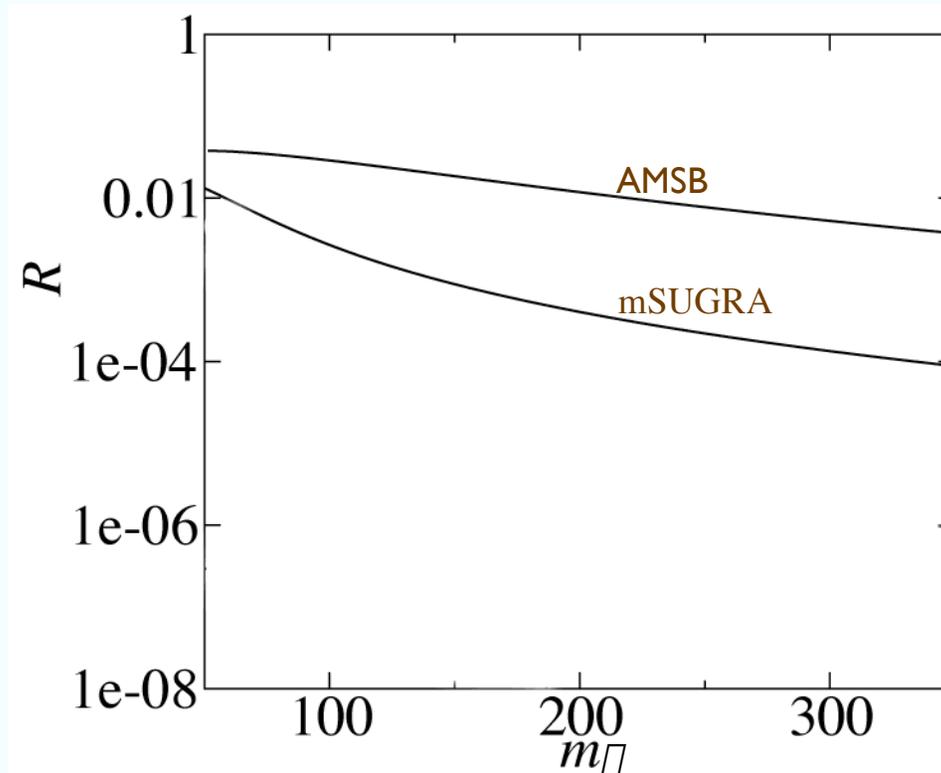

Gauginos at colliders

AMSB is sick

AMSB is curable

Conclusions

Elastic scattering of neutralinos on ^{73}Ge

- R is in events/day/kg.
- For mSUGRA: $M_1 = \tilde{m}/3$, $M_2 = 2\tilde{m}/3$, $\tan\beta = 4$.
- For AMSB: $M_1 = 3\tilde{m}/2$, $M_2 = \tilde{m}/2$.
- In common: $\tan\beta = 4$, $m_{\text{squark}} = 2 \text{ TeV}$, $m_A = 500 \text{ GeV}$, $A = 0$.

AMSB gauginos at colliders

Motivation

AMSB is fascinating

AMSB is detectable

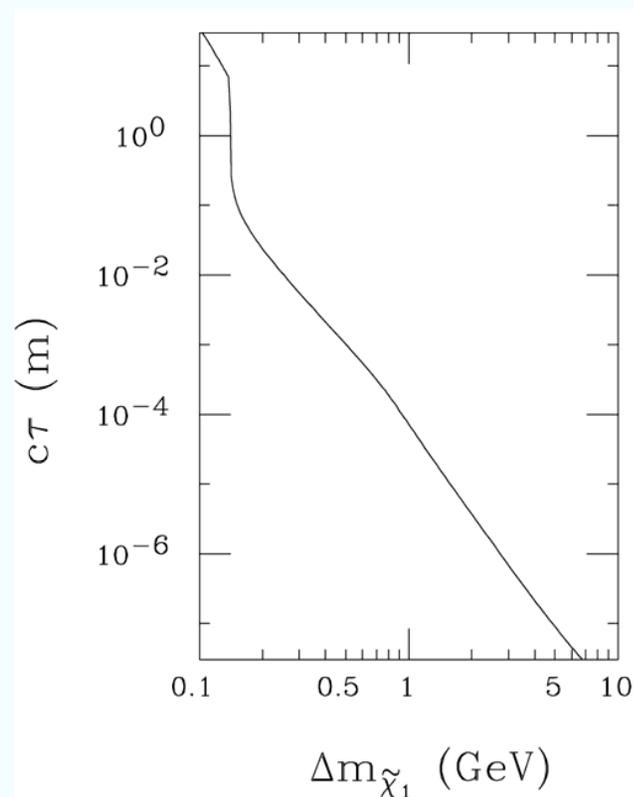

AMSB CDM

Gauginos at colliders

AMSB is sick

AMSB is curable

Conclusions

- The lightest chargino mass is $\sim M_2$, nearly degenerate with the lightest neutralino mass.
- Chargino decays may have observable vertex displacement at colliders.

I. Gunion, Mrenna

Brandon Murakami, ANL

September 10, 2003

AMSB is sick

Motivation

AMSB is fascinating

Origin

Soft masses

Thresholds

\hat{m} term

CP violation

AMSB is detectable

AMSB is sick

AMSB is curable

Conclusions

- All slepton soft masses are negative m^2 at low scales:

$$m_{\tilde{L}}^2 = \mp [\text{gauge}] + [\text{Yukawa}]$$

$$m_{\tilde{L}}^2 = \left[\frac{99}{50} g_1^4 - \frac{3}{2} g_2^4 + y_e \hat{m}_e \right] \tilde{m}^2$$

$$m_{\tilde{e}}^2 = \left[\frac{198}{25} g_1^4 + 2 y_e \hat{m}_e \right] \tilde{m}^2$$

- Electromagnetism is broken.
- UV insensitivity makes slepton solutions tricky.
- If not for this, AMSB would probably be the standard paradigm.

AMSB is curable

Motivation

AMSB is fascinating

AMSB is detectable

AMSB is sick

AMSB is curable

Existing solutions

D-term solutions

Ancillary $U(1)$

Reconciliation
with prior efforts

Conclusions

- Help comes in two forms:
 - Change the low energy theory (the MSSM)
 - Faint echos from exotics in a high energy theory
- Ways to change the MSSM:

$$m_{\tilde{L}}^2 = \left[\begin{array}{c} \square \\ \square \\ \square \end{array} \right] \frac{99}{50} g_1^4 \left[\begin{array}{c} \square \\ \square \end{array} \right] \frac{3}{2} g_2^4 + y_e \hat{\square}_e \left[\begin{array}{c} \square \\ \square \end{array} \right] \tilde{m}^2$$

D-terms in supersymmetry

Motivation

AMSB is fascinating

AMSB is detectable

AMSB is sick

AMSB is curable

Existing solutions

D-term solutions

Ancillary U(1)

Reconciliation

with prior efforts

Conclusions

- The vector superfield consists of
 - a vector field,
 - a fermion (gaugino) field,
 - and a non-propagating auxiliary (scalar) field, called “D”.

- By its e.o.m., $D = -g(\sum_i Q_i)$.

- D-terms exist in all supersymmetric gauge theories. For U(1)'s,

$$L = \frac{1}{2} g^2 \sum_i q_i \phi_i^* \phi_i.$$

- If any of these scalars have a vev, mass is generated for all scalars. Typically,

$$m_{\phi}^2 = q_i g \langle D \rangle \quad \text{typically, } m_{\phi}^2 = q_i m_{\text{soft}}^2$$

- ...simultaneously, the U(1) becomes a massive Z':

$$L = (D_{\mu} \phi)^{\dagger} (D_{\mu} \phi) \quad \text{where } D_{\mu} \phi = (\partial_{\mu} - igq_i A_{\mu}) \phi$$

AMSB is curable

Existing solutions

D -term solutions

Ancillary $U(1)$

Reconciliation
with prior efforts

Conclusions

1. Origin of the D -term vev
2. The crossing of thresholds
3. The charge assignments of the Q, u, d, L, e, H_u, H_d and exotic multiplets.
4. Proper electroweak symmetry breaking.
5. Z - Z' kinetic mixing
6. Z - Z' mass mixing

Some of these can only be addressed
with explicit model building.

Our $U(1)$ selection

Motivation

AMSB is fascinating

AMSB is detectable

AMSB is sick

AMSB is curable

Existing solutions

D-term solutions

Ancillary $U(1)$

Reconciliation
with prior efforts

Conclusions

- What motivated $U(1)$'s are on the market?
 - $B-L$, $U(1)_{\square}$ from E_6 , hypercharge, ...?
 - All have opposite signs for the L and e multiplets.
- Our focus, only consider $U(1)$'s that:
 1. Preserve gauge unification.
 2. (Chiral) anomaly free.
- ...also:
 - (MS)SM matter charged under the $U(1)$.
 - Generation independent charges.
 - Not broken by exotic scalars that alter the pure AMSB spectrum.
 - No Yukawa interactions with (MS)SM matter.
 - No communication with heavy friends.
- May create a light or heavy Z .
- We are not model building.

Charge assignments of the ancillary $U(1)$

Motivation

AMSB is fascinating

AMSB is detectable

AMSB is sick

AMSB is curable

Existing solutions

D-term solutions

Ancillary $U(1)$

Reconciliation
with prior efforts

Conclusions

- We require the absence of chiral anomalies.
 - i.e., eliminate YYX , YXX , XXX , $SU(2)SU(2)X$, $SU(3)SU(3)X$, and gravitational anomalies.

- Along with charge conservation for $U(1)_a$:

$$Q_L = 3q$$

$$Q_e = r$$

$$Q_Q = \square q$$

$$Q_u = \square(2q + r)$$

$$Q_d = 4q + r$$

$$Q_{H_u} = 3q + r$$

$$Q_{H_d} = \square(3q + r)$$

- Two parameters.
- Same signs for the L and e multiplets are possible!
- Singlets are required to break the $U(1)$. Assume irrelevant low-scale phenomenology.

AMSB is curable

Existing solutions

D -term solutions

Ancillary $U(1)$

Reconciliation
with prior efforts

Conclusions

- We learn, this slepton solution necessitates:
 - Q soft mass must decrease.
 - u soft mass must decrease.
 - d soft mass must increase.
- Measuring a few soft masses, reveals the entire scalar spectrum (for the 1st and 2nd generations).
 - Say we know the soft scale from gauginos.
 - Measuring the selectron mass reveals the D -term vev.
 - Measuring any other scalar, reveals parameter q .
 - All 1st and 2nd generation scalars masses are then revealed.
- The heaviest scalar partner cannot be heavier than $\sim 6\tilde{m}^2$.
 - Due to the requirement that 1st generation sleptons have positive mass.

AMSB is curable

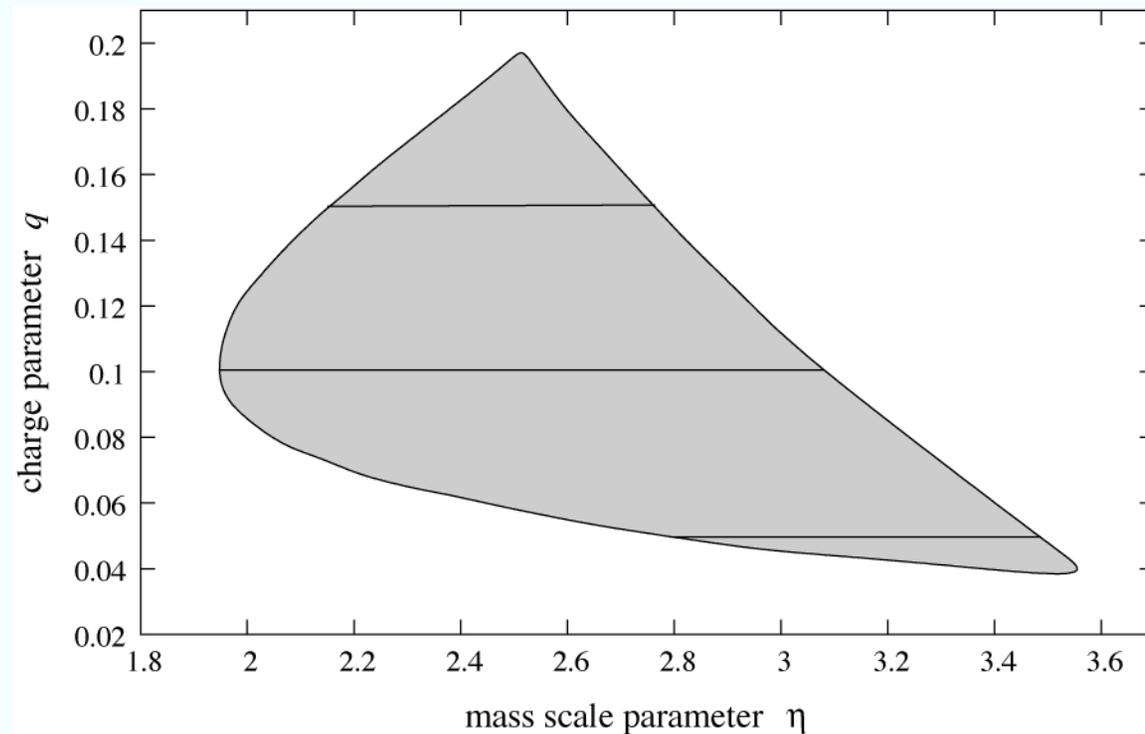

Existing solutions

D -term solutions

Ancillary $U(1)$

Reconciliation

with prior efforts

Conclusions

- B - L and exotic hypercharge D -terms. (Arkani-Hamed, et al.)
 - Two D -terms necessary due to opposite charge assignments for L and e .
 - Exotic hypercharge D -term vev established through kinetic mixing with B - L .
 - No kinetic term for B - L .
- Kinetic mixing free $U(1)$ and exotic D -terms. (Jack, Jones)
 - Kinetic mixing arises through loops.
 - Exotic charges set by $\text{Tr}(YQ) = 0$.
 - D -term vevs established through Fayet-Iliopoulos terms.

$$L \quad \square \square D \quad \square \quad \langle D \rangle = \square$$

- Both yield viable sparticle spectrums.

Reconciliation with prior efforts (2)

Motivation
 AMSB is fascinating
 AMSB is detectable
 AMSB is sick
 AMSB is curable
 Existing solutions
 D-term solutions
 Ancillary $U(1)$
 Reconciliation
 with prior efforts
 Conclusions

- All (chiral) anomaly free $U(1)$'s that preserve gauge unification are specific manifestations of the ancillary $U(1)$.
 - For Y , $q = -1/6$ and $r = 1$.
 - For $B-L$, $q = -1/3$ and $r = 1$.
 - For $J\&J$, $q = -7/3$ and $r = 3$.
- Furthermore, the existing solutions with two D -terms can be mapped to a single ancillary $U(1)$.

- Take $B-L$ and Y , for example:

$$Q_i^a D_a = Y_i D_Y + Q_i^{B\&L} D_{B\&L} \quad (D_a \equiv \square \tilde{m}^2)$$

- We recast:

$$D_a = r_Y D_Y + r_{B\&L} D_{B\&L} \quad \text{and} \quad q = \frac{q_Y D_Y + q_{B\&L} D_{B\&L}}{r_Y D_Y + r_{B\&L} D_{B\&L}} \quad (r = 1)$$

- Try H_u :

$$\begin{aligned} Q_{H_u}^a D_a &= (3q + r) D_a \\ &= \frac{\begin{matrix} \square \\ \square \\ \square \end{matrix} \begin{matrix} \square \\ \square \\ \square \end{matrix} \left(\begin{matrix} \square \\ \square \\ \square \end{matrix} \frac{1}{6} \right) D_Y + \left(\begin{matrix} \square \\ \square \\ \square \end{matrix} \frac{1}{3} \right) D_{B\&L}}{\begin{matrix} \square \\ \square \\ \square \end{matrix} \begin{matrix} \square \\ \square \\ \square \end{matrix} (1) D_Y + (1) D_{B\&L}} + (1) \begin{matrix} \square \\ \square \\ \square \end{matrix} \left\{ (1) D_Y + (1) D_{B\&L} \right\} \\ &= \frac{1}{2} D_Y + 0 D_{B\&L} \end{aligned}$$

AMSB is detectable

AMSB is sick

AMSB is curable

Existing solutions

D-term solutions

Ancillary $U(1)$

Reconciliation with
prior efforts

Conclusions

- No reasonable way to distinguish the $U(1)$ choices via sparticle measurements alone.
 - The ancillary $U(1)$ should have rational charges.
 - The $B-L$ and J&J scenarios have irrational ancillary $U(1)$ charges.
 - (Furthermore, kinetic mixing of the ancillary and hypercharge $U(1)$ s yield irrational effective charges.)

Summary

Motivation

AMSB is fascinating

AMSB is detectable

AMSB is sick

AMSB is curable

Conclusions

- **AMSB is fascinating:**
 - Anomaly mediated supersymmetry breaking is present in all broken supergravity theories.
 - The pure AMSB spectrum is very immune from high scale physics.
 - Pure AMSB does not have flavor problems.
 - Pure AMSB has other desirable theoretical properties.
- **AMSB has distinct experimental signatures:**
 - Detectable rates for cold dark matter.
 - Detectable displaced vertex in chargino to neutralino decays.
- **AMSB is sick:**
 - Pure AMSB has broken electromagnetism.
- **AMSB is curable:**
 - Many slepton solutions exist. None are sufficiently compelling.
 - D -term slepton solutions are motivated and viable.
 - **The ancillary $U(1)$ formalism:**
 1. Retains gauge coupling unification.
 2. Is chiral anomaly free.
 3. Allows model independent predictions about the sparticle spectrum.
 4. Reconciles past efforts employing 2 D -terms into a single D -term solution.
 5. Retains the unique gaugino spectrum of AMSB.
 6. Retains the unique scalar spectrum of AMSB.

Motivation

AMSB is fascinating

AMSB is detectable

AMSB is sick

AMSB is curable

Conclusions

\square term concerns

Motivation

AMSB is fascinating

Origin

Soft masses

Thresholds

\square term

CP violation

AMSB is detectable

AMSB is sick

AMSB is curable

Conclusions

- All supersymmetric standard models must address the origin of the \square term.

- AMSB has relatively simple \square term solutions.

- For example, consider the effective operator

$$L \quad \square d^4 \square c \frac{S + S^+}{m_{\text{P}}} H_u H_d \square^+ \square + \text{h.c.} .$$

- Also, the resulting bilinear soft term is

$$B = \frac{1}{2} (\square_{H_u} + \square_{H_d}) \langle F \rangle .$$

CP violation concerns

Motivation

AMSB is fascinating

Origin

Soft masses

Thresholds

\square term

CP violation

AMSB is detectable

AMSB is sick

AMSB is curable

Conclusions

- Strong CP concerns:
 - CP violation constraints require that the trilinear and bilinear soft terms, A_i and B , be on order $1/100$.
 - At the high scale, rotate away any phases for A_i and B .
 - The trilinear couplings then have no problem.
 - The phase of B is model-dependent, but the example \square term solution has no problem.
- \square_k concerns:
 - Also model dependent.
 - Possibly, there's nothing in the bulk to communicate CP violation from the hidden to visible sector.
